* Select the heater closest to the wattage noted in the chart, size up to the next heater when the wattage does not match.

* This Chart is based on the heater producing a 60°F Temperature rise, for example when the outside is 10°F the garage could be heated to 70°F, but not more. In addition, the chart assumes the garage is adequately insulated for the local climate.

* For additional garage heating application information refer to the King website link:
